## GRAVITY WALL DESIGN - LRFD

## STONE STRONG PRECAST MODULAR BLOCK

This engineering section presents information for design of Stone Strong retaining walls in a gravity configuration using Load and Resistance Factor Design (LRFD) procedures.
The design methodologies presented conform substantially to AASHTO specifications (LRFD Bridge Specifications, $8^{\text {th }}$ Edition, 2017). This section includes the following documents:

LRFD Gravity Wall Design Methodology (17 pages)
Example LRFD Gravity Wall Calculations (22 pages)
Example LRFD Spreadsheet Output (12 pages)

The example calculations and example spreadsheet output match identical design conditions and are intended as verification of the spreadsheet method. Note that the Gravity Analysis Spreadsheet is available on the Stone Strong website.

## GRAVITY WALL LRFD DESIGN METHODOLOGY STONE STRONG PRECAST MODULAR BLOCK

Evaluate gravity retaining wall using strength design approach (Load and Resistance Factor Design) following AASHTO analytical techniques - refer to:

AASHTO LRFD Bridge Design Specifications, $9^{\text {th }}$ Edition 2020
Additional analytical methods and theories are taken from previous AASHTO specifications and other FHWA guidelines - refer to:

Design and Construction of Mechanically Stabilized Earth Walls and Reinforced Soil Slopes, NHI-10-024

AASHTO Standard Specifications for Highway Bridges 2002, $17^{\text {th }}$ Addition

## Properties of Soil/Aggregate

Soil and material properties should be determined for the specific materials to be used:
unit fill - $\gamma_{u}=110 \mathrm{pcf}\left(17.3 \mathrm{kN} / \mathrm{m}^{3}\right)$ max (see AASHTO 2002 5.9.2) \& $\phi_{\mathrm{u}}$
leveling base $-\gamma_{b} \& \phi_{b}$ for typical aggregate base (or concrete base may be substituted)
retained soil $-\gamma \& \phi$ by site conditions (where select backfill is used, select material must encompass entire retained soil influence zone)
foundation soil - $\gamma \phi \& c$ by site conditions
interface angle (see AASHTO LRFD Table C3.11.5.9-1)
For stepped modules, when the block width varies within a vertical section, $\delta=3 / 4 \phi$
For cases where all blocks are substantially uniform width, $\delta=1 / 2 \phi$
Note: infill weight is reduced to account for infill not engaged by modular units in overturning. Only $80 \%$ of the weight of aggregate is included in the overturning calculations, W' (see AASHTO LRFD 11.11.4.4)

## Precast Modular Unit Geometric Properties

dimensions are for battered units - for vertical face 24 SF units, the width and center of gravity dimensions are all reduced by 25 mm

Wall stability calculations are performed per unit length of wall, so all weights and forces are expressed per foot or $m$ of wall length.

Typical gravity wall configuration with precast stepped modules, variables, and nomenclature:

Note that surcharge loads over the top of the wall are treated separately from surcharge behind the wall.

| Project LRFD Design Methodology | Project \# 20004.00 | Date $12 / 5 / 23$ |
| :---: | :---: | :--- |

Typical gravity wall with cast in place tail extension, variables, and nomenclature:

| Project LRFD Design Methodology | Project \# 20004.00 | Date $12 / 5 / 23$ |
| :---: | :---: | :--- |

Wall units that vary in width are referred to as "stepped" modules. Wider wall units are typically placed at the bottom of the wall. In addition to using wider precast units, the stability of a gravity wall can be improved by using cast-in-place tail extensions to increase the width of the units. The width of the CIP extension is not limited, but it is recommend that the height be at least 2 times the width to provide shear through the tail openings (unless connecting with reinforcing steel).

## Wall batter

The block units may be installed with either a vertical face or a battered face. In vertical applications, the units are be installed with no batter or setback between units, $\omega=0^{\circ}$

In a battered configuration, the 24-44, 24-62, 24-86, and 24-ME units are 36 inches ( 914 mm ) high and the next block atop a 24 SF block will batter back 4 inches ( 102 mm ). The 6-44 and 6-28 units are 18 inches ( 457 mm ) tall, and the next block atop a 6 SF block will batter 2 inches ( 51 mm ).
These blocks may be interchanged within a wall stack, but the batter is determined by the height of the unit below.

4 in. setback per 24 SF block ( 36 in. tall)
2 in. setback per 6 SF block (18 in. tall)

102 mm setback per 24 SF block ( 914 mm tall) 51 mm setback per 6 SF block ( 457 mm tall)

The face batter is calculated as:

$$
\begin{array}{ll}
\omega=\arctan (4 / 36)=6.34^{\circ} & \omega=\arctan (102 / 914)=6.34^{\circ} \\
\text { or } \omega=\arctan (2 / 18)=6.34^{\circ} & \omega=\arctan (51 / 457)=6.34^{\circ}
\end{array}
$$

For uniform modules, the batter of the back face matches the batter of the front face. For stepped modules, the batter is recalculated along the back of the wall from the rear of the bottom unit to the rear of the top of the wall (see AASHTO LRFD 3.11.5.9). Use $\omega^{\prime}$ in Coulomb equation and earth pressure component calculations. To calculate $\omega$ ' it is necessary to know the effective setback width, $\mathrm{w}_{\mathrm{s}}$, which is the horizontal distance between the back edge of the top block and the back edge of the lower unit including any tail extension. $w_{s}$ is negative when the mass extender projects further than the back of the top block. Knowing this distance and the height of wall:

$$
\omega^{\prime}=\arctan \left(\omega_{\mathrm{s}} / \mathrm{H}_{\mathrm{w}}\right)
$$

## Base Thickness/Embedment

The type and thickness of wall base or leveling pad and depth of embedment can vary by site requirements. A granular base with a thickness of 9 inches is commonly used, but the thickness can be adjusted to reduce the contact pressure. A concrete leveling pad or footing can also be used. The required embedment to the top of the base is related to the exposed height of the wall and by the slope at the toe, as well as other factors. The required embedment can be calculated for slopes steeper than 6H:1V using the following equation (see AASHTO LRFD Table C11.10.2.2-1):

$$
h_{e}=H^{\prime} /\left(20^{*} S / 6\right)
$$

where S is the run of the toe slope per unit fall and $\mathrm{H}^{\prime}$ is the exposed height

A minimum embedment of 12 inches ( 300 mm ) for level toe and 24 inches ( 600 mm ) for toe slopes of $4 \mathrm{H}: 1 \mathrm{~V}$ or steeper is recommended for highway applications (AASHTO LRFD 11.10.2.2)

## LRFD Design Methodology

| Project \# | 20004.00 | Date |
| :--- | :--- | :--- |
|  |  | $12 / 5 / 23$ |

## Weight of Wall

The weight of the wall includes the contributions of the blocks, the aggregate unit fill, the tail extension, and the soil wedge atop extended modules or tail extension

The weight of the tail extension is calculated:
$W_{\text {te }}=\left(W_{\text {te }} * H_{\text {te }}\right) * 145 \mathrm{pcf}\left(22.8 \mathrm{kN} / \mathrm{m}^{3}\right)$
(typical unit weight for concrete)
where $\mathrm{w}_{\mathrm{te}}$ is the width of the tail extension and $\mathrm{H}_{\mathrm{te}}$ is the height of the extension (both in ft .)

The angle of the batter (from vertical) of the soil wedge above the tail extension, $\omega_{\mathrm{s}}$, is calculated:

$$
\omega_{\mathrm{s}}=\arctan \left(-\mathrm{w}_{\mathrm{s}}^{\prime} / \mathrm{H}_{\text {wedge }}\right)
$$

The weight of soil in the wedge above the tail extension is calculated for the trapezoidal area of the wedge that lies behind each block
$h_{s}=$ height of the soil trapezoid behind the block (may differ from height of the block)
$\mathrm{w}_{\mathrm{u}}=$ width of the block
$h_{1}=$ dist. from the top of wall to top of the soil trapezoid behind the block
$\mathrm{h}_{2}=$ dist. from the top of wall to bottom of the soil trapezoid behind the block
$\mathrm{s}=$ dist. from the face of wall to face of the block
$\mathrm{s}_{\mathrm{u}}=$ dist. from the face of wall to back of the block $=\mathrm{s}+\mathrm{w}_{\mathrm{u}}$
$\mathrm{S}_{\mathrm{T}}=$ dist. from the face of wall to the back of top-most block of wall
$\mathrm{b}_{1}=$ length of top side of trapezoid of soil behind block $=\mathrm{h}_{1}{ }^{*} \tan \left(\omega_{\mathrm{s}}\right)+\left(\mathrm{S}_{\mathrm{T}}-\mathrm{S}_{\mathrm{u}}\right)$
$\mathrm{b}_{2}=$ length of bottom side of trapezoid of soil behind block $=\mathrm{h}_{2} * \tan \left(\omega_{\mathrm{S}}\right)+\left(\mathrm{S}_{\mathrm{T}}-\mathrm{S}_{\mathrm{u}}\right)$

The weight of the soil wedge above the tail extension behind each block, $\mathrm{W}_{\mathrm{s}}$, is calculated as the trapezoidal area multiplied by the lesser of the unit weight of the retained soil or the unit fill:

$$
\mathrm{W}_{\mathrm{s}}=\left[\mathrm{h}_{\mathrm{s}}^{*}\left(\mathrm{~b}_{1}+\mathrm{b}_{2}\right) / 2\right] *\left(\min \text { of } \gamma_{\mathrm{ret}} \text { or } \gamma_{\mathrm{u}}\right)
$$

The center of gravity of the trapezoidal wedge behind each block, measured from the face of the wall at the bottom course, is calculated:

$$
\begin{aligned}
& x_{s}=\left[\left(b_{1}{ }^{*} b_{2}+\left(b_{2}{ }^{2}-2^{*} b_{1}{ }^{*} b_{2}+b_{1}{ }^{2}\right) / 3\right) /\left(b_{1}+b_{2}\right)\right]+s+w_{u} \\
& y_{s}=\left[h_{s} / 3^{*}\left(2 b_{1}+b_{2}\right) /\left(b_{1}+b_{2}\right)\right]+H-h_{2}
\end{aligned}
$$

$\mathrm{W}_{\mathrm{s}}$ is treated as aggregate infill subject to $80 \%$ limitations for overturning calculations (conservative)

| Project \# 20004.00 | Date |  |
| :--- | :--- | :--- |

## Static Forces

## Coulomb active earth pressure coefficient (see AASHTO LRFD 3.11.5.3)

$$
\mathrm{K}_{\mathrm{a}}=\frac{\cos ^{2}\left(\phi+\omega^{\prime}\right)}{\cos ^{2}\left(\omega^{\prime}\right) \cos \left(\omega^{\prime}-\delta\right)\left[1+\sqrt{\frac{\sin (\phi+\delta) \sin (\phi-\beta)}{\cos \left(\omega^{\prime}-\delta\right) \cos \left(\omega^{\prime}+\beta\right)}}\right]^{2}}
$$

As an alternate, a trial wedge technique may be used to determine the earth pressure forces acting on the modular wall.

## Earth Load Components (see AASHTO LRFD 11.10.5.2)

Vertical forces:

$$
\begin{aligned}
& P_{v}=0.5 K_{a} \gamma H^{2 *} \sin \left(\delta-\omega^{\prime}\right) \\
& Q_{\mathrm{lv}}=K_{a} Q H^{*} \sin \left(\delta-\omega^{\prime}\right) \text { where } Q \text { is the effective surcharge in } \mathrm{psf}(\mathrm{kPa})
\end{aligned}
$$

Horizontal forces:

$$
\begin{aligned}
& P_{\mathrm{h}}=0.5 \mathrm{~K}_{\mathrm{a}} \gamma \mathrm{H}^{2 *} \cos \left(\delta-\omega^{\prime}\right) \\
& \mathrm{Q}_{\mathrm{h}}=\mathrm{K}_{\mathrm{a}} Q \mathrm{H}^{*} \cos \left(\delta-\omega^{\prime}\right) \text { where } Q \text { is the effective surcharge in } \mathrm{psf}(\mathrm{kPa})
\end{aligned}
$$

Resultants of earth load components:

$$
\begin{aligned}
& \mathrm{y}_{\mathrm{P}}=\mathrm{H} / 3 \\
& \mathrm{x}_{\mathrm{P}}=(\mathrm{H} / 3)^{*} \tan \left(\omega^{\prime}\right)+\mathrm{w}_{\mathrm{u}} \\
& \mathrm{y}_{\mathrm{Ql}}=\mathrm{H} / 2 \\
& \mathrm{x}_{\mathrm{Q} 1}=(\mathrm{H} / 2)^{*} \tan \left(\omega^{\prime}\right)+\mathrm{w}_{\mathrm{u}}
\end{aligned}
$$

$$
\text { where } \mathrm{w}_{\mathrm{u}} \text { is the width of the bottom unit, including any tail extension }\left(\mathrm{w}_{\mathrm{te}}\right)
$$

| Project LRFD Design Methodology | Project \# 20004.00 | Date $12 / 5 / 23$ |
| :---: | :---: | :--- |

## Weight Components

Vertical forces:
$\mathrm{W}_{\mathrm{b}}$ - Weight of wall units
$\mathrm{W}_{\text {te }}$ - Weight of concrete tail extension, if used
$\mathrm{W}_{\mathrm{a}}$ - Weight of infill aggregate (use $80 \%$ aggregate weight for overturning)
$\mathrm{W}_{\mathrm{s}}$ - Weight of soil atop tail extension (use $80 \%$ aggregate weight for overturning)

$$
\begin{aligned}
& \mathrm{W}_{\mathrm{b}}=\sum\left(\mathrm{W}_{\mathrm{b} 1}+\mathrm{W}_{\mathrm{b} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{bn}}\right) \\
& \mathrm{W}_{\mathrm{te}}=\Sigma\left(\mathrm{W}_{\mathrm{te} 1}+\mathrm{W}_{\mathrm{te} 2}+\cdots \cdots+\mathrm{W}_{\mathrm{te}}\right) \\
& \mathrm{W}_{\mathrm{a}}=\Sigma\left(\mathrm{W}_{\mathrm{a} 1}+\mathrm{W}_{\mathrm{a} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{an}}\right) \\
& \mathrm{W}_{\mathrm{s}}=\Sigma\left(\mathrm{W}_{\mathrm{s} 1}+\mathrm{W}_{\mathrm{s} 2}+\cdots \cdot++\mathrm{W}_{\mathrm{sn}}\right)
\end{aligned}
$$

Resultants of weight components:

The center of mass of the stack of blocks is calculated as:

$$
\begin{aligned}
& \mathrm{x}_{\mathrm{b}}=\sum\left(\mathrm{W}_{\mathrm{b} 1}{ }^{*} \mathrm{x}_{\mathrm{b} 1}+\mathrm{W}_{\mathrm{b} 2}{ }^{*} \mathrm{x}_{\mathrm{b} 2}+\cdots \cdot+\mathrm{W}_{\mathrm{bn}}{ }^{*} \mathrm{x}_{\mathrm{bn}}\right) / \sum\left(\mathrm{W}_{\mathrm{b} 1}+\mathrm{W}_{\mathrm{b} 2}+\cdots \cdot+\mathrm{W}_{\mathrm{bn}}\right) \\
& \mathrm{y}_{\mathrm{b}}=\sum\left(\mathrm{W}_{\mathrm{b} 1}{ }^{*} \mathrm{y}_{\mathrm{b} 1}+\mathrm{W}_{\mathrm{b} 2}{ }^{*} \mathrm{y}_{\mathrm{b} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{bn}}{ }^{*} \mathrm{y}_{\mathrm{bn}}\right) / \sum\left(\mathrm{W}_{\mathrm{b} 1}+\mathrm{W}_{\mathrm{b} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{bn}}\right)
\end{aligned}
$$

The center of mass of the aggregate fill is:

$$
\begin{aligned}
& \mathrm{x}_{\mathrm{a}}=\sum\left(\mathrm{W}_{\mathrm{a} 1}{ }^{*} \mathrm{x}_{\mathrm{a} 1}+\mathrm{W}_{\mathrm{a} 2}{ }^{*} \mathrm{x}_{\mathrm{a} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{an}}{ }^{*} \mathrm{x}_{\mathrm{an}}\right) / \sum\left(\mathrm{W}_{\mathrm{a} 1}+\mathrm{W}_{\mathrm{a} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{an}}\right) \\
& \mathrm{y}_{\mathrm{a}}=\sum\left(\mathrm{W}_{\mathrm{a} 1}{ } \mathrm{y}_{\mathrm{a} 1}+\mathrm{W}_{\mathrm{a} 2}{ }^{*} \mathrm{y}_{\mathrm{a} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{an}}{ }^{*} y_{\mathrm{an}}\right) / \sum\left(\mathrm{W}_{\mathrm{a} 1}+\mathrm{W}_{\mathrm{a} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{an}}\right)
\end{aligned}
$$

The center of mass of the soil wedge over the tail is:

$$
\begin{aligned}
& \mathrm{x}_{\mathrm{s}}=\sum\left(\mathrm{W}_{\mathrm{s} 1}{ }^{*} \mathrm{x}_{\mathrm{s} 1}+\mathrm{W}_{\mathrm{s} 2}{ }^{*} \mathrm{x}_{\mathrm{s} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{sn}}{ }^{*} \mathrm{x}_{\mathrm{sn}}\right) / \sum\left(\mathrm{W}_{\mathrm{s} 1}+\mathrm{W}_{\mathrm{s} 2}+\cdots \cdot+\mathrm{W}_{\mathrm{sn}}\right) \\
& \mathrm{y}_{\mathrm{s}}=\sum\left(\mathrm{W}_{\mathrm{s} 1}{ }^{*} \mathrm{y}_{\mathrm{s} 1}+\mathrm{W}_{\mathrm{s} 2}{ }^{*} \mathrm{y}_{\mathrm{s} 2}+\cdots \cdots \cdot+\mathrm{W}_{\mathrm{sn}}{ }^{*} \mathrm{y}_{\mathrm{sn}}\right) / \sum\left(\mathrm{W}_{\mathrm{s} 1}+\mathrm{W}_{\mathrm{s} 2}+\cdots \cdot \cdot+\mathrm{W}_{\mathrm{sn}}\right)
\end{aligned}
$$

The center of mass of the tail extension can be calculated with the following equation:

$$
\begin{aligned}
& \mathrm{x}_{\mathrm{te}}=\sum\left(\mathrm{W}_{\mathrm{te} 1}{ }^{*} \mathrm{X}_{\mathrm{te} 1}+\mathrm{W}_{\mathrm{te} 2}{ }^{*} \mathrm{x}_{\mathrm{te} 2}+\cdots \cdots+\mathrm{W}_{\mathrm{ten}}{ }^{*} \mathrm{x}_{\mathrm{ten}}\right) / \sum\left(\mathrm{W}_{\mathrm{te} 1}+\mathrm{W}_{\mathrm{te} 2}+\cdots \cdots+\mathrm{W}_{\mathrm{te}}\right) \\
& \mathrm{y}_{\mathrm{te}}=\sum\left(\mathrm{W}_{\mathrm{te} 1}{ }^{*} \mathrm{y}_{\mathrm{te} 1}+\mathrm{W}_{\mathrm{te} 2}{ }^{*} \mathrm{y}_{\mathrm{te} 2}+\cdots \cdots \cdot+\mathrm{W}_{\mathrm{ten}}{ }^{*} \mathrm{y}_{\mathrm{ten}}\right) / \sum\left(\mathrm{W}_{\mathrm{te} 1}+\mathrm{W}_{\mathrm{te} 2}+\cdots \cdots+\mathrm{W}_{\mathrm{te}}\right)
\end{aligned}
$$

The overall adjusted center of mass of the blocks and tail extension:

$$
\begin{aligned}
& \mathrm{x}_{\mathrm{b}+\mathrm{e} \mathrm{e}}=\left(\mathrm{W}_{\mathrm{b}}{ }^{*} \mathrm{x}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}{ }^{*} \mathrm{x}_{\mathrm{te}}\right) /\left(\mathrm{W}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}\right) \\
& \mathrm{y}_{\mathrm{b}+\mathrm{te}}=\left(\mathrm{W}_{\mathrm{b}}{ }^{*} \mathrm{y}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}^{*} \mathrm{y}_{\mathrm{te}}\right) /\left(\mathrm{W}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}\right)
\end{aligned}
$$

The overall adjusted center of mass of the aggregate and the soil above the tail is:

$$
\begin{aligned}
& x_{\mathrm{a}+\mathrm{s}}=\left(\mathrm{Wa}^{*} x_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}{ }^{*} x_{\mathrm{s}}\right) /\left(\mathrm{W}_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}\right) \\
& y_{\mathrm{a}+\mathrm{s}}=\left(\mathrm{W}_{\mathrm{a}}{ }^{*} y_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}{ }^{2} y_{\mathrm{s}}\right) /\left(\mathrm{W}_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}\right)
\end{aligned}
$$

## Seismic Loads

Seismic components of force are calculated according to the procedures in FHWA 4.2h.
The maximum acceleration $A_{m}=(1.45-A)^{*} A$ where $A$ is the peak horizontal ground acceleration.

The seismic earth pressure coefficient is calculated with the following equation:

$$
K_{a e}=\frac{\cos ^{2}\left(\phi+\omega^{\prime}-\xi\right)}{\cos (\xi) \cos ^{2}\left(-\omega^{\prime}\right) \cos \left(\delta-\omega^{\prime}+\xi\right)\left[1+\sqrt{\frac{\sin (\phi+\delta) \sin (\phi-\xi-\beta)}{\cos \left(\delta-\omega^{\prime}+\xi\right) \cos \left(\omega^{\prime}+\beta\right)}}\right]^{2}}
$$

where $\xi=\arctan \left[k_{h} /\left(1-k_{v}\right)\right]$

The trial wedge technique is recommended in high seismicity regions to determine the dynamic thrust forces acting on the modular wall.

## Seismic Earth load components

$k_{v}$ is generally taken as $0 . k_{h}$ is the maximum horizontal acceleration of the wall, and is a function of the maximum allowable displacement of the wall during a seismic event. It is calculated with the following equation:

$$
\begin{array}{ll}
\mathrm{k}_{\mathrm{h}}=0.74 * \mathrm{~A}_{\mathrm{s}} *\left[\mathrm{~A}_{s} /(\mathrm{d})\right]^{0.25} & \text { (where } \mathrm{d} \text { is in inches) } \\
\mathrm{k}_{\mathrm{h}}=1.66 * \mathrm{~A}_{\mathrm{s}} *\left[\mathrm{~A}_{s} /(\mathrm{d})\right]^{0.25} & \text { (where } \mathrm{d} \text { is in mm) }
\end{array}
$$

$d$ is the maximum horizontal displacement and is typically set at 2 inches ( 50 mm ) as conservative.

$$
A_{s}=P G A * F_{p g a}
$$

$k_{h}$ is generally taken as no greater than $1 / 2$ of $A_{s}$
The horizontal inertial force $\mathrm{P}_{\mathrm{ir}}$ is calculated as follows:

$$
\mathrm{P}_{\mathrm{ir}}=\left(\mathrm{W}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}+\mathrm{W}_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}\right)^{*} \mathrm{k}_{\mathrm{h}}
$$

The seismic thrust is calculated as follows:

$$
\begin{aligned}
& \Delta \mathrm{P}_{\mathrm{ae}}=0.5^{*} \gamma^{*} \mathrm{H}^{2} *\left(\mathrm{~K}_{\mathrm{ae}}-\mathrm{K}_{\mathrm{a}}\right) \\
& \Delta \mathrm{P}_{\mathrm{aeh}}=0.5^{*} \gamma^{*} \mathrm{H}^{2} *\left(\mathrm{~K}_{\mathrm{ae}}-\mathrm{K}_{\mathrm{a}}\right)^{*} \cos \left(\delta-\omega^{\prime}\right) \\
& \Delta \mathrm{P}_{\mathrm{aev}}=0.5^{*} \gamma^{*} \mathrm{H}^{2} *\left(\mathrm{~K}_{\mathrm{ae}}-\mathrm{K}_{\mathrm{a}}\right)^{*} \sin \left(\delta-\omega^{\prime}\right)
\end{aligned}
$$

## Resultants of Seismic Earth load components

In overturning analysis, the inertial force is applied at the vertical center of gravity of the wall, while the seismic thrust is applied at $1 / 3$ of the wall height.

| Project \# 20004.00 | Date |  |
| :---: | :--- | :--- |

$$
\begin{aligned}
& \mathrm{x}_{\mathrm{Pae}}=\mathrm{H} / 3^{*} \tan \left(\omega^{\prime}\right)+\mathrm{W}_{\mathrm{u}} \\
& \mathrm{y}_{\mathrm{Pae}}=\mathrm{H} / 3 \\
& \mathrm{y}_{\mathrm{Pir}}=\left(\mathrm{W}_{\mathrm{b}}{ }^{*} \mathrm{y}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}{ }^{*} \mathrm{y}_{\mathrm{te}}+\mathrm{W}_{\mathrm{a}}{ }^{*} \mathrm{y}_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}{ }^{*} \mathrm{y}_{\mathrm{s}}\right) /\left(\mathrm{W}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}+\mathrm{W}_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}\right)
\end{aligned}
$$

The combined earth pressure $\mathrm{P}_{\mathrm{ae}}$ is the sum of the static earth pressure $\mathrm{P}_{\mathrm{a}}$ and the seismic thrust $\Delta \mathrm{P}_{\text {ae }}$. By AASHTO LRFD requirements, two seismic load conditions must be evaluated (AASHTO LRFD 11.6.5.1):

$$
\begin{aligned}
& \mathrm{P}_{\mathrm{ae}} / 2+\mathrm{P}_{\mathrm{ir}}=\mathrm{P}_{\mathrm{a}} / 2+\Delta \mathrm{P}_{\mathrm{ae}} / 2+\mathrm{P}_{\mathrm{ir}} \quad \text { (but not less than } \mathrm{P}_{\mathrm{a}}+\mathrm{P}_{\mathrm{ir}} \text { ) } \\
& \mathrm{P}_{\mathrm{ae}}+\mathrm{P}_{\mathrm{i}} / 2=\mathrm{P}_{\mathrm{a}}+\Delta \mathrm{P}_{\mathrm{ae}}+\mathrm{P}_{\mathrm{i} /} / 2
\end{aligned}
$$

Load cases $\mathrm{a} \& \mathrm{~b}$ are separately evaluated to include the alternate combinations above.

## Base Friction

Friction across the base of the wall is used to resist sliding failure. Frictional resistance must be determined both between the wall assembly and the base and between the base and the foundation soil (or through the foundation soil).

The unfactored sliding resistance is calculated as the smaller result of the following equations:
For base to foundation soil failure, use:

$$
\begin{aligned}
& \mathrm{R}_{\mathrm{s}(f \text { foundation soil) }}=\left(\mathrm{W}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}+\mathrm{W}_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}+\mathrm{P}_{\mathrm{v}}+\mathrm{t}_{\mathrm{b}}{ }^{*} \mathrm{~W}_{\mathrm{b}}{ }^{*} \gamma_{\mathrm{b}}\right) \tan \phi+\mathrm{B}_{\mathrm{w}}{ }^{*} \mathrm{C} \\
& \\
& =\left(\mathrm{F}_{\mathrm{v}}+\mathrm{W}_{\text {base })}{ }^{*} \tan \phi+\mathrm{B}_{\mathrm{w}}{ }^{*} \mathrm{C}\right.
\end{aligned}
$$

where $\phi$ represents foundation soils, $\mathrm{B}_{\mathrm{w}}$ is base width (block width plus $1 / 2 \mathrm{H}: 1 \mathrm{~V}$ distribution through base), and c represents foundation soil cohesion.

For block to base material sliding, use:

$$
R_{\mathrm{s}(\text { footing })}=\mu_{\mathrm{b}}\left(\mathrm{~W}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}+\mathrm{W}_{\mathrm{a}}+\mathrm{W}_{\mathrm{s}}+\mathrm{P}_{\mathrm{v}}\right)=\mu_{\mathrm{b}}\left(\mathrm{~F}_{\mathrm{v}}\right)
$$

where $\mu_{\mathrm{b}}$ represents a composite coefficient of friction for the base

The composite friction coefficient is calculated using contributory areas. The base of a Stone Strong unit consists of a percentage of open void space to be filled with aggregate and a percentage of concrete. These percentages are calculated as follows:
$\%_{\text {void }}=\mathrm{V}_{\text {void }} /\left(\mathrm{V}_{\text {void }}+\mathrm{V}_{\text {concrete }}\right)$
$\%_{\text {concrete }}=\mathrm{V}_{\text {concrete }} /\left(\mathrm{V}_{\text {void }}+\mathrm{V}_{\text {concrete }}\right)$

If a cast-in-place tail extension is used, the area of the tail extension must also be calculated and the total area is also increased accordingly. Thus, the equation for composite friction coefficient across the base becomes:
$\mu_{\mathrm{b}}=\left(\%\right.$ void $^{*} \mathrm{~W}_{\mathrm{u}(\text { bottom })}{ }^{*} \mu_{\mathrm{p}-\text { unit fillbase }}+\%$ concrete $\left.{ }^{*} \mathrm{~W}_{\mathrm{u}(\text { bottom })}{ }^{*} \mu_{\mathrm{p}-\text { block/base }}+\mathrm{W}_{\mathrm{te}}{ }^{*} \mu_{\mathrm{p}-\text { extension/base }}\right) /\left(\mathrm{W}_{\mathrm{u}(\text { bottom })}+\mathrm{W}_{\mathrm{te}}\right)$

Since the unit fill aggregate is typically placed to a moderately loose state, the friction angle for the screened unit fill aggregate typically controls for the interface between the unit fill and the base aggregate.
If actual test data for the project specific materials is not available, or for preliminary design, the following conservative friction angles are suggested for base and infill aggregates: (see AASHTO LRFD Fig. 10.4.6.2.4-1)

|  | Friction Angle (degrees) |  |  |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
| Crushed Hard Aggregate <br> $>75 \%$ w/ 2 fractured faces, hard natural rock | 42 | 40 | 36 |
| Crushed Aggregate <br> $>75 \%$ w/ 2 fractured faces, medium natural rock or recycled concrete | 40 | 38 | 35 |
| Cracked Gravel >90\% w/ 1 fractured face | 36 | 35 | 32 |
| Note: Physical testing of specific aggregates is recommended. When test data is not available, these typical values may be used at the discretion of the user. The licensed engineer of record is responsible for all design input and for evaluating the reasonableness of calculation output based upon his/her knowledge of local materials and practices and on the specific design details. |  |  |  |

Table of Unfactored Forces \& Moments

|  | Force <br> (lb) or (kN) | Arm <br> (ft) or (m) | Moment about toe (lb*ft) or (kN *m) |

| inertial force* | $\mathrm{Pir}^{*}{ }^{\text {E }}$ Q | $\mathrm{Pir}^{*}{ }^{*} \mathrm{yPir}^{*}{ }^{*} \mathrm{EQ}$ |

* For seismic load case, separate analysis should be run using a) reduced combined earth pressure ( $50 \%$ of $P_{h}+\Delta P_{\text {aeh }}$, but not less than $\mathrm{P}_{\mathrm{h}}$ ) with the full inertial force ( $\mathrm{P}_{\mathrm{ir}}$ ) and $\mathbf{b}$ ) full earth pressure ( $\mathrm{P}_{\mathrm{h}}+\Delta \mathrm{P}_{\mathrm{aeh}}$ ) with reduced inertial force ( $50 \%$ of $\mathrm{P}_{\mathrm{ir}}$ ).

## Overturning/Eccentricity

For overturning, the modified weights using $80 \%$ of the aggregate weight (including the soil over the tail extension) are used for all overturning calculations.
Although not an explicit requirement of the AASHTO specification, the driving and resisting overturning moments should be compared:

| $\mathrm{M}^{\prime} v$ | $\Sigma$ factored moments from vertical forces (using $80 \% \mathrm{~W}_{\mathrm{s}} \& \mathrm{~W}_{\mathrm{a}}$ ) |
| :---: | :---: |
| $\mathrm{M}_{\mathrm{H}}$ | $\Sigma$ factored moments from horizontal forces |

For each load case, the factored overturning resistance should be greater than the factored overturning load

Check that $\mathrm{M}^{\prime}$ v $>\mathrm{M}_{\mathrm{H}}$

This behavior rarely controls. The AASHTO specification uses eccentricity as a proxy for overturning (but still using $80 \%$ of the infill weight).

| Project LRFD Design Methodology | Project \# 20004.00 | Date $12 / 5 / 23$ |
| :--- | :--- | :--- |

Eccentricity should be calculated to check overturning. For an aggregate base, the resultant of the vertical forces must fall within the center $2 / 3$ of the base, so eccentricity must be less than $1 / 3$ times the base width (see AASHTO LRFD 11.6.3.3)

$$
\mathrm{B} / 3=\left(\mathrm{w}_{\mathrm{u}(\text { bottom unit) }}+\mathrm{w}_{\mathrm{te}}\right) / 3
$$

For a concrete base, or a base bearing on rock, the resultant of the vertical forces must fall within the center $90 \%$ of the base, so eccentricity must be less than $45 \%$ of the base width (see AASHTO LRFD 11.6.3.3).
$\mathrm{B}^{*} 0.45=\left(\mathrm{w}_{\mathrm{u} \text { (bottom unit) }}+\mathrm{w}_{\text {te }}\right)^{*} 0.45$
For the Extreme load cases, the resultant of the vertical forces must fall within the center $80 \%$ of the base, so eccentricity must be less than $40 \%$ times the base width (see AASHTO LRFD 11.6.5.1)

$$
\mathrm{B}^{*} 0.4=\left(\mathrm{w}_{\mathrm{u}(\text { bottom unit) }}+\mathrm{w}_{\text {te }}\right)^{*} 0.4
$$

(note that for EQ between 0.0 and 1.0, interpolate between $1 / 3$ and 0.4 )

Eccentricity or the location of the vertical resultant is calculated as:

| F'v | $\Sigma$ factored vertical forces (using 80\% W $\mathrm{W}_{\mathrm{s}}$ \& $\mathrm{W}_{\mathrm{a}}$ ) |
| :---: | :---: |
| $M^{\prime}$ | $\Sigma$ factored moments from vertical forces (using 80\% W $\mathrm{W}_{\mathrm{s}}$ \& $\mathrm{W}_{\mathrm{a}}$ ) |
| $\mathrm{M}_{\mathrm{H}}$ | $\Sigma$ factored moments from horizontal forces |
| e | $\mathrm{e}=\left(\mathrm{w}_{\mathrm{u} \text { (bottom) }}+\mathrm{w}_{\text {te }}\right) / 2+\left(M_{H}-\mathrm{M}^{\prime}{ }^{\prime}\right) / \mathrm{F}^{\prime}{ }_{V}$ |

For each load case, verify that the eccentricity is less than $1 / 3$ of the base width (or $45 \%$ for concrete base, or $40 \%$ for Extreme load cases)

Check that $\mathrm{e}<\mathrm{B} / 3$, or $\mathrm{B}^{*} 0.45$, or $\mathrm{B}^{*} 0.40$

## Sliding

For each load case, the minimum value for sliding resistance is calculated. A resistance factor of 0.8 is used for a cast in place interface (concrete base or a cast in place tail extension), and a factor of 0.9 is used in all other cases.

| $\mathrm{F}_{\mathrm{H}}$ | $\Sigma$ factored horizontal forces |
| :---: | :---: |
| $\mathrm{F}_{\mathrm{V}}$ | $\Sigma$ factored vertical forces (using $\left.100 \% \mathrm{~W}_{\mathrm{s}} \& \mathrm{~W}_{\mathrm{a}}\right)$ |
| $\mathrm{R}_{\mathrm{s} \text { (footing) }}$ | $\mu_{\mathrm{b}} \mathrm{F}_{\mathrm{V}}{ }^{*} \phi_{\tau}$ |
| $\mathrm{R}_{\mathrm{s} \text { (foundation soil) }}$ | $\left[\left(\mathrm{F}_{\mathrm{V}}+\mathrm{W}_{\text {base }}{ }^{*} \tan (\phi)+\mathrm{B}_{\mathrm{w}}{ }^{*} \mathrm{c}^{*} \phi_{\tau}\right.\right.$ |
| $\phi_{\tau}$ | 0.8 for cast in place base or extension, 0.9 for other cases |
|  |  |
| $\min \mathrm{R}_{\mathrm{s}}$ | smaller of $\mathrm{R}_{\mathrm{s}}$ (footing) or $\mathrm{R}_{\mathrm{s} \text { (foundation soil) }}$ |

For each load case, the factored sliding resistance should be greater than the sum of factored horizontal forces

$$
\text { check that } \min R_{s}>F_{H}
$$

## Bearing

Load Case Strength I-b generally controls bearing.
$B_{f}^{\prime}$ is the equivalent bearing area. This is the base block width adjusted for eccentricity, and including a $1 / 2 \mathrm{H}: 1 \mathrm{~V}$ distribution through granular base or $1 \mathrm{H}: 1 \mathrm{~V}$ distribution through concrete base.

$$
\begin{aligned}
& B_{f}^{\prime}=w_{u}+w_{t e}+t_{b}-2^{*} e \quad \text { or } \\
& B_{f}^{\prime}=w_{u}+w_{t e}+2^{*} t_{b}-2^{*} e \text { (for concrete base) }
\end{aligned}
$$

| Fv | $\Sigma$ factored vertical forces (using 100\% W $\mathrm{W}_{\text {s }} \mathrm{W}_{\mathrm{a}}$ ) |
| :---: | :---: |
| surcharge over wall | $\mathrm{qLL}^{*} \mathrm{~W}_{\text {u(top) }}{ }^{*} \mathrm{LL}$ |
| weight of base | $t_{b}{ }^{*} \gamma_{b}{ }^{*} \mathrm{EH}$ |
| $\mathrm{M}_{\mathrm{v}}$ | $\Sigma$ factored moments from vertical forces (using 100\% W $\mathrm{W}_{\mathrm{s}}$ \& $\mathrm{W}_{\mathrm{a}}$ ) |
| $\mathrm{M}_{\mathrm{H}}$ | $\Sigma$ factored moments from horizontal forces |
| e | $\left(w_{u}+w_{\text {te }}\right) / 2-\left(M_{v}-M_{H}\right) / F_{V}$ |
| $\mathrm{Bf}^{\prime}$ (granular base) | $\mathrm{w}_{\mathrm{u}}+\mathrm{w}_{\text {te }}+\mathrm{t}_{\mathrm{b}}-2^{*} e$ |
| $\mathrm{Bf}^{\prime}$ (concrete base) | $\mathrm{w}_{\mathrm{u}}+\mathrm{w}_{\text {te }}+2^{*} \mathrm{t}_{\mathrm{b}}-2^{*} e$ |
| contact pressure $\mathrm{q}_{\mathrm{c}}$ | $\left(\mathrm{F}_{\mathrm{V}}+\mathrm{qLL}^{*}{ }^{*} \mathrm{~W}_{\mathrm{u}(\text { top) }}{ }^{*} \mathrm{LL}\right) / \mathrm{B}_{\mathrm{f}}{ }^{\prime}+\mathrm{tb}^{*} \gamma_{\mathrm{b}}{ }^{*} \mathrm{EH}$ |
| bearing resistance $\mathrm{q}_{\mathrm{b}}$ | $\left[\mathrm{c}^{*} \mathrm{~N}_{\mathrm{c}}{ }^{*} \mathrm{~d}_{\mathrm{c}}{ }^{*} \mathrm{~g}_{\mathrm{c}}+\left(\mathrm{h}_{\mathrm{e}}+\mathrm{t}_{\mathrm{b}}\right)^{*} \gamma_{\text {found }}{ }^{*} \mathrm{~N}_{\mathrm{q}}{ }^{*} \mathrm{~d}_{\mathrm{q}}{ }^{*} \mathrm{~g}_{\mathrm{q}}+0.5{ }^{*} \gamma_{\text {found }}{ }^{*} \mathrm{Bf}^{\prime *} \mathrm{~N}_{\gamma}{ }^{*} \mathrm{~d}_{\gamma}{ }^{*} \mathrm{~g}_{\gamma}\right]^{*} \mathrm{BC}$ |

| Project \# |  |  |
| :---: | :--- | :--- |
| 20004.00 | Date | $12 / 5 / 23$ |

Note that inclined loading factors are customarily ignored for retaining systems (see AASHTO LRFD C10.6.3.1.2a).

For each load case, the factored bearing resistance should be greater than the factored contact pressure Check that qb > qc

## Internal Analysis

Internal stability analysis is conducted for each section above the wall base. Since bearing conditions are addressed in the external stability analysis, only toppling and shear failures are evaluated.

Toppling is evaluated similarly to external overturning analysis, except that the overturning point is set in 1 inch ( 25 mm ) to account for face rounding. Eccentricity for block to block contact should be within the middle $90 \%$ of the base as required for a rock foundation.

For each load case:
check that $\mathrm{e}<\mathrm{B}^{*} 0.45$

Shear, or sliding, resistance is calculated based on the interface shear test (see interaction test reports for complete test data)

$$
\begin{aligned}
& \mathrm{R}_{\mathrm{S}}=\left[\mathrm{S}_{\mathrm{i}}+\left(\mathrm{W}+\mathrm{P}_{\mathrm{v}}+\mathrm{Q}_{\mathrm{dv}}\right)^{*} \tan \left(35.2^{\circ}\right)\right]^{*} \varphi_{\mathrm{T}} \\
& \text { where } \varphi_{\mathrm{T}}=0.90 \text { (precast to precast and aggregate to aggregate) } \\
& \quad \mathrm{S}_{\mathrm{i}}=362 \mathrm{lb} / \mathrm{ft} \text { or } 5.28 \mathrm{kN} / \mathrm{m}
\end{aligned}
$$

For each load case, the factored sliding resistance must be greater than the factored horizontal force:

$$
\text { check that } R_{s}>F_{H}
$$

At a minimum, internal stability should be evaluated at each change in block width (including any tail extension), at the base of any dual-face units, and for the top course(s) if a surcharge or lateral load is applied.

## EXAMPLE GRAVITY WALL CALCULATIONS

## LRFD METHOD USING AASHTO LOAD/RESISTANCE FACTORS

Example 1: 12 feet tall wall, vertical face, level back slope, 250 psf traffic surcharge
Retained Soil: sand with $\gamma=120$ pcf and $\phi=30$ degrees
Foundation Soil: $\quad$ clay with $\gamma=125 \mathrm{pcf}, \phi=26$ degrees, and $c^{\prime}=150 \mathrm{psf}$
Infill Aggregate: screened crushed aggregate with $\gamma=110$ pcf and $\phi=35$ degrees
Base Aggregate: well graded crushed aggregate with $\gamma=125 \mathrm{pcf}$ and $\phi=40$ degrees

## Internal Stability

Internal stability should be checked at each change in block width, at all dual-face unit, and at the top unit at a minimum. The following is taken at the first change from $24-86$ to $24-44$. Internal stability of the block stack above this interface is calculated as follows:

Wall Configuration (all weights per foot along length of wall)

| Modular Units |  |  | Setback (in) |  | Concrete (/ft.) |  | Unit Fill (/ft.) |  | Soil Wedge (/ft.) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| unit | w (in) | h (ft) | face | tail | $\mathrm{W}_{\mathrm{b}}$ (lb) | $\mathrm{x}_{\mathrm{b}}$ (in) | Wa (lb) | $\mathrm{xa}_{\mathrm{a}}(\mathrm{in})$ | $\mathrm{W}_{\mathrm{s}}$ (lb) | $\mathrm{x}_{\mathrm{s}}$ (in) |
| V6-28 | 28.0 | 1.50 | 0.0 | -15.0 | 238 | 11.8 | 183 | 13.0 | 110 | 32.3 |
| V6-44 | 44.0 | 1.50 | 0.0 | 1.0 | 375 | 20.0 | 301 | 22.5 | 0 | 0.0 |
| V24-44 | 43.0 | 3.00 | 0.0 | 0.0 | 750 | 19.2 | 594 | 22.8 | 0 | 0.0 |

## Weight and Center of Gravity of Wall Components

$$
\begin{aligned}
& \mathrm{W}_{\mathrm{b}}=750+375+238=1,363 \mathrm{lb} / \mathrm{ft} \\
& \mathrm{~W}_{\mathrm{a}}=594+301+183=1,078 \mathrm{lb} / \mathrm{ft} \\
& \mathrm{~W}_{\mathrm{s}}=110 \mathrm{lb} / \mathrm{ft} \\
& x_{b}=\left(750^{*} 19.2+375^{*} 20.0+238^{*} 11.8\right) / 1,363=18.1 \mathrm{in} \\
& y_{\mathrm{b}}=\left(750^{*} 18+375^{*} 45+238^{*} 63\right) / 1,363=33.3 \mathrm{in} \\
& x_{\mathrm{a}}=\left(594^{*} 22.8+301^{*} 22.5+183^{*} 13.0\right) / 1,078=21.1 \mathrm{in} \\
& y_{a}=\left(594^{*} 18+301^{*} 45+183^{*} 63\right) / 1,078=33.2 \mathrm{in} \\
& x_{\mathrm{s}}=32.3 \mathrm{in} \\
& y_{\mathrm{s}}=110^{*} 60 / 110=60 \mathrm{in} \\
& x_{a+s}=\left(1,078^{*} 21.1+110^{*} 32.3\right) /(1,078+110)=22.1 \mathrm{in} \\
& y_{a+s}=\left(1,078^{*} 33.3+110^{*} 60\right) /(1,078+110)=35.7 \mathrm{in}
\end{aligned}
$$

## Earth Pressure Components

$$
\begin{aligned}
& \omega^{\prime}=\arctan (-15 / 12 / 6.0)=-11.77^{\circ} \quad \delta=0.75^{*} 30=22.5^{\circ} \\
& \qquad \mathrm{K}_{\mathrm{a}}=\frac{\cos ^{2}(30+-11.77)}{\cos ^{2}(-11.77) \cos (22.5--11.77)\left[1+\sqrt{\frac{\sin (30+22.5) \sin (30-0)}{\cos (22.5--11.77) \cos (-11.77+0)}}\right]^{2}} \\
& \mathrm{~K}_{\mathrm{a}}=0.394 \\

## External Stability Analysis

## Weight and Center of Gravity of Wall Components

$\mathrm{W}_{\mathrm{b}}+\mathrm{W}_{\mathrm{te}}=\left(750+145^{*} 2.0 * 3.0\right)+(750+145 * 2.0 * 1.5)+750+375+375=4,305 \mathrm{lb} / \mathrm{ft}$
$\mathrm{W}_{\mathrm{a}}=594+594+594+301+301=2,385 \mathrm{lb} / \mathrm{ft}$
$\mathrm{W}_{\mathrm{s}}=311+396+85+19=811 \mathrm{lb} / \mathrm{ft}$
$\mathrm{x}_{\mathrm{b}+\mathrm{te}}=(1,620 * 39.9+1,185 * 38.0+750 * 29.2+375 * 33.0+375 * 35.0) / 4,305=36.5 \mathrm{in}$
$\mathrm{y}_{\mathrm{b}+\mathrm{te}}=(1,620 * 18+1,185 * 54+750 * 90+375 * 117+375 * 135) / 4,305=59.3$ in
$x_{a}=(594 * 24.8+594 * 28.8+594 * 32.8+301 * 35.5+301 * 37.5) / 2,385=30.7$ in
$y_{\mathrm{a}}=\left(594 * 18+594^{*} 54+594^{*} 90+301^{*} 117+301^{*} 135\right) / 2,385=72.2$ in
$x_{s}=\left(311^{*} 71.1+396 * 59.3+85^{*} 59.2+19^{*} 58.9\right) / 811=63.8$ in
$y_{s}=\left(311 * 60.0+396 * 88.8+85^{*} 116.3+19 * 132\right) / 811=81.7$ in
$\mathrm{x}_{\mathrm{a}+\mathrm{s}}=\left(2,385 * 30.7+811^{*} 63.8\right) /(2,385+811)=39.1$ in
$y_{\text {a+s }}=(2,385 * 72.2+811 * 81.7) /(2,385+811)=74.6$ in

## Earth Pressure Components

$$
\omega^{\prime}=\arctan (-10 / 12 / 12.0)=-3.97^{\circ} \quad \delta=0.75^{*} 30=22.5^{\circ}
$$

$K_{a}=0.444$
$P_{h}=0.5^{*}(0.444)^{*} 120^{*}(12)^{2 *} \cos (22.5+3.79)=3,436 \mathrm{lb}$
$P_{v}=0.5^{*}(0.444)^{*} 120^{*}(12)^{2 *} \sin (22.5+3.79)=1,711 \mathrm{lb}$
$\mathrm{x}_{\mathrm{p}}=(12 / 3)^{*} \tan (-3.97)+(68 / 12)=5.39 \mathrm{ft}$
$y_{p}=(12 / 3)=4.00$

## Overturning/Eccentricity

Check that M'v $>\mathrm{M}_{\mathrm{H}}$
Check that e>B/3 (40\% of B for extreme load cases)

Strength Case l-a:

$$
\begin{aligned}
& M_{V}^{\prime}=11,777+8,337+13,831=33,944 \mathrm{lb} * \mathrm{ft} / \mathrm{ft} \\
& M_{H}=20,615 \mathrm{lb} * \mathrm{ft} / \mathrm{ft} \\
& M_{V}^{\prime}>M_{H} \quad \underline{O K!!} \\
& e=(68 / 12) / 2+(20,615-33,944) /(3,875+2,557+2,567)=1.35 \mathrm{ft} \\
& B / 3=(68 / 12) / 3=1.89 \mathrm{ft} \\
& e<B / 3 \quad \underline{O K!!}
\end{aligned}
$$

Table for all load cases

|  | Strength I-a | Strength I-b | Strength IV | Service I |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{F}^{\prime}{ }_{v}$ | 8,998 | 11,399 | 12,476 | 8,573 |
| $\mathrm{M}^{\prime}{ }_{\mathrm{v}}$ | 33,944 | 41,442 | 44,713 | 30,643 |
| $\mathrm{M}_{\mathrm{h}}$ | 20,615 | 20,615 | 20,615 | 13,744 |
| e | 1.35 | 1.01 | 0.90 | 0.86 |

All load cases $\underline{\text { OK!!! }}$

## Sliding

Check that $\mathrm{R}_{\mathrm{s}}>\mathrm{F}_{\mathrm{h}}$

Strength Case I-a:
Use the smaller sliding resistance, $\mathrm{R}^{\prime}$, across footing or through foundation soil:

$$
\begin{aligned}
\mathrm{R}_{\mathrm{s}(\text { soil })}^{\prime} & =\left[\left(3,875+3,196+2,567+(68 / 12)^{*}(9 / 12)^{*} 110^{* 1} 1.0\right)^{*} \tan (26)^{*}((68+9) / 12)^{*} 150\right]^{*} 0.9 \\
& =5,330 \mathrm{lb} / \mathrm{ft}
\end{aligned}
$$

Tail extension is assumed to be on aggregate base
$\%$ void $=(594 / 110) /(594 / 110+750 / 145+24 / 12 * 3)=0.2281$
$\%_{\text {precast }}=(750 / 145) /(594 / 110+750 / 145+24 / 12 * 3)=0.2095$
$\%_{\text {CIP }}=\left(24 / 12^{*} 3\right) /(594 / 110+750 / 145+24 / 12 * 3)=0.3038$
$\mu_{\mathrm{b}}=\left(0.2281^{*} \tan (35)+0.2095^{*} 0.8^{*} \tan (40)+0.3038^{*} \tan (40)\right)=0.74$
$\mathrm{R}_{\mathrm{s} \text { (footing) }}=0.9^{*} 0.74^{*}(3,875+3,196+2,567)$
$=6,419 \mathrm{lb} / \mathrm{ft}$
$\mathrm{F}_{\mathrm{h}}=5,154 \mathrm{lb} / \mathrm{ft}$
$R_{s}>F_{h} \quad \underline{O K!}!$

| $\mathrm{R}^{\prime}$ (footing) | 6,419 | 8,167 | 8,884 | 6,817 |

## All Load Cases OK!!

## Bearing

Check that $q_{b}>q_{c}$

Strength Case I-a:

$$
\begin{aligned}
& \mathrm{e}=((68 / 12) / 2+(20,615-11,777+10,421+13,831) /(3,875+3,196+2,567)=1.23 \\
& \mathrm{Bf}_{\mathrm{f}}^{\prime}=(68+9) / 12-2^{*} 1.23 \mathrm{ft}=3.95 \mathrm{ft}
\end{aligned}
$$

Bearing Factors (Vesic):

$$
\begin{array}{lll}
\mathrm{N}_{\mathrm{q}}=11.85 & \mathrm{~N}_{\mathrm{c}}=22.25 & \mathrm{~N}_{\gamma}=12.54 \\
\mathrm{~d}_{\mathrm{c}}=1.14 & \mathrm{~d}_{\mathrm{q}}=1.11 & \mathrm{~d}_{\mathrm{\gamma}}=1.00 \\
\mathrm{~g}_{\mathrm{c}}=1.00 & \mathrm{~g}_{\mathrm{q}}=1.00 & \mathrm{~g}_{\mathrm{\gamma}}=1.00
\end{array}
$$

$$
\mathrm{q}_{\mathrm{b}}=\left[150 * 22.25^{*} 1.14 * 1.00+(12+9) / 12^{*} 125^{*} 11.85 * 1.11^{*} 1.00+\right.
$$

$$
0.5 * 125 * 3.96 * 12.54] * 0.45 * 1.10 * 1.00=4,406 \mathrm{psf}
$$

$$
\begin{aligned}
& \text { weight of base }=\mathrm{t}_{\mathrm{b}}{ }^{*} \gamma_{\text {base }}{ }^{*} \mathrm{EH}=9 / 12^{*} 125^{*} 1.5=141 \mathrm{psf} \\
& \mathrm{q}_{\mathrm{c}}=(9,637) / 3.95+141=2,581 \mathrm{psf} \\
& \mathrm{q}_{\mathrm{b}}>\mathrm{q}_{\mathrm{c}} \quad \underline{\text { OK!! }}
\end{aligned}
$$

## Overturning/Topple

Check that M'V $>\mathrm{M}_{\mathrm{H}}$
Check that e<B*0.45 (40\% of B for extreme load cases)

Strength Case I-a:
$M^{\prime} v=2,543+2,047+642=5,221 \mathrm{lb} * f t / f t$
$M_{H}=2,180 \mathrm{lb}$ fft $/ \mathrm{ft}$
$M_{V}>M_{H} \quad \underline{O K!}!$
$\mathrm{e}=(43) / 12 / 2+(2,180-5,221) /(1,350+957+166)=0.56 \mathrm{ft}$
$B^{*} 0.45=(43 / 12)^{*} 0.45=1.61 \mathrm{ft}$
$e<B^{*} 0.45$ OK!!
Table for all load cases

|  | Strength I-a | Strength I-b | Strength IV | Service I |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{F}^{\prime} \stackrel{2,473}{ }$ | 3,333 | 3,708 | 2,568 |  |
| $\mathrm{M}^{\prime}{ }_{\mathrm{v}}$ | 5,221 | 6,926 | 7,632 | 5,293 |
